

Industrial Steam System Optimization

2-Day User Training

Presented by:

Ven V. Venkatesan, P.E., CEM

VGA Engineering Consultants Inc, USA

and

Oliver Fischer, DI MSc

SEWEN - ENERGY Management & Engineering

Training Modules Developed initially by:

Greg Harrell, Ph.D., P.E. & Riyaz Papar, P.E., CEM

January, 2017

Cairo, Egypt

Acknowledgments

- UNIDO Team – Vienna, Austria
- UNIDO Team – Cairo, Egypt
- United States Department of Energy – USA
- Oak Ridge National Laboratory – USA

Ven V. Venkatesan, PE, CEM

➤ Education

- **M. Tech. (Chemical Engineering), University of Madras, India**
- **B. Tech. (Chemical Engineering), University of Madras, India.**
- **Diploma in I.E. (Industrial Engineering), IIE, Mumbai.**

➤ Professional Experience

- **General Manager, VGA Engineering Consultants Inc.**
 - Energy Cost reduction in Process Industries & Steam system reliability improvement
- **Director-Engineering Services, Armstrong Service Inc. (1996 – 2006)**
 - Engineering services for both its domestic & international operations
- **Senior Process Engineer, Refineria ISLA (Curazao). (1991 – 1996)**
 - Secretary of its Energy & Loss Steering Committee and an expert in the Combustion
- **Senior Energy Consultant, M K Raju Consultants (P) Ltd. (1986 – 1991)**
 - Identifying energy cost saving opportunities at all types of major process industries.
- **Assistant Manager, (Energy & Economy), Bokaro Steel Plant. SAIL (1978 – 1986)**
 - Worked in the fuel efficiency, fuel gas Control, Gas Cleaning plants, Gas Mixing & Boosting stations, Gas Holders & excess Gas Flares.

Ven V. Venkatesan, PE, CEM

➤ Other Qualifications & Affiliations

- Professional Engineer License, in the States of Florida & Wyoming
- Certified Energy Manager
- Green Building Engineer
- US DOE Steam and Process Heating Energy Expert
- US DOE Process Heating System Expert

Riyaz Papar, P.E., CEM

➤ Education

- **M.S. (Mechanical Engineering), University of Maryland, College Park**
- **B.Tech. (Mechanical Engineering), Indian Institute of Technology, Mumbai**

➤ Professional Experience

- **Director - Energy & Carbon Services, Hudson Technologies**
 - Performance Monitoring & Optimization of Energy Systems
- **Energy Consultant**
 - Industrial Steam systems, Refrigeration, Chillers & Process Systems, Waste Heat Recovery
 - Chemicals, Petroleum Refining, Food, Pulp & Paper – Manufacturing Sector
- **Development Manager, Enron Energy Services**
 - Lead on Project Development for Industrial Clients
- **Principal Research Associate, Lawrence Berkeley National Laboratory**
 - Development of Tools & Resources, Technical Support to US DOE BestPractices
- **Senior Project Engineer, Energy Concepts Company**
 - Industrial Ammonia-Water Waste heat-fired refrigeration systems

Riyaz Papar, P.E., CEM

➤ Other Qualifications & Affiliations

- Professional Engineer, State of Maryland, USA
- Certified Energy Manager
- US DOE Steam BestPractices Lead Instructor & Technical Advisor
- US DOE Steam Energy Expert
- UNIDO Energy Expert – Steam, Refrigeration & Chillers and Waste Heat Recovery
- IFC Energy Expert for the Cleaner Production Team
- Chair, ASME Process Industries Division, 2003-04
- Chair, ASHRAE Technical Committee 8.2: Centrifugal Machines, 2009-10
- Chair, ASHRAE Technical Committee 1.10: Cogeneration Systems, 2010-11

Greg Harrell, Ph.D., P.E.

➤ Education

- **Ph.D. Mechanical Engineering-Thermodynamics, Virginia Tech (VPI&SU) – 1997**

➤ Professional Experience

- **1987 to 1993 - Design Engineer, Utilities Process Engineer, BASF Corp.**
 - Oversight for engineering, technical activities of entire utilities department (steam production, electric power generation, compressed air systems, industrial refrigeration facilities, industrial HVAC systems, water filtration facilities and wastewater treatment plant)
- **At Virginia Tech – Mechanical Engineering Professor, Energy Management Institute (EMI)**
 - From 1997 to 2001 - Director of Technical Assistance for EMI
 - Undergraduate and graduate level thermodynamics professor
 - Directly involved in important aspects of energy management for industries located worldwide
 - Has conducted numerous energy surveys for industrial clients throughout the world - on 6 continents, in 22 countries, and in 36 of the United States
 - Developed U.S. DOE Steam End User Training and U.S. DOE Steam Specialist Qualification Training
 - Played major role in development of the USDOE Steam Tools and authored Steam System Survey Guide, which has become a text for university mechanical engineering courses
 - U.S.DOE Compressed Air Challenge Certified Instructor

Greg Harrell, Ph.D., P.E.

➤ Professional Experience

- **Currently – Consultant for Energy Management Services**

- Primary roles continue to include industrial systems energy analysis and individual process analyses, industrial training courses, university instruction, energy system modeling, and software development
- A primary instructor in the North Carolina State University Energy Management Diploma Program
- Major system focus areas - boilers, steam systems, combined heat and power systems (cogeneration), gas turbines, and compressed air systems

Oliver Fischer, DI, M.Sc.,

➤ Education

- Postgraduate Master of Science Degree in Environmental Technology and International Affairs awarded by the Vienna University of Technology in 2010, cooperation with the Diplomatic Academy Vienna
- University Master Degree in Mechanical Engineering with specialisation in Process Engineering awarded by the Vienna University of Technology, in 1997

➤ Professional Experience

- Engineering Consultant on Energy MGMT, Efficiency & Renewables Solutions, Energy Audit & Efficiency Projects, Austria, since Jan 2015
- Project MGMT & Engineering: Fruit Juice Project, Uganda (Oct-2013 to Dec-2014)
- Project Development: Solar Fruit Drying Project, Uganda - Energy Efficiency measures
- Engineering Consultant Start-Up on Energy Efficiency & Renewables:
- Engineering Consultant certification, EUREM certification
- Chiller Waste Heat Utilisation Project, Austria – Proj. MGMT & Engineering
- Voluntary entrance into Internal Unit (Siemens) for professional reorientation

Oliver Fischer, DI, M.Sc.,

➤ Professional Experience

- Siemens Energy, Germany / Concentrating Solar Power (CSP) Plants (Sep 2011- Sep 2013)
 - Senior Engineer for Concentrating Solar Power Plants, CSP Execution Projects in Spain:
 - Team Leader Mechanical, Bid Engineer and Coach for CSP Project
- Siemens Energy, Germany / Combined Cycle Power Plants (CCPP) (Jul 2010- Aug 2011)
 - Team Lead & Engineering for Enecogen 870MW CCPP, the Netherlands:
 - Erection Supervisor for Chemical Systems & Gas Supply Systems
 - Project Engineer & Environmental Compliance Engineer
- VATECH Hydro, Austria / Combined Cycle Power Plants (CCPP) (May 2002- Dec 2007)
 - Team Lead Gas Turbine Engineering - Bucuresti Vest CCPP, Romania
 - Team Lead, System & Commissioning Engineer for Thessaloniki 390MW CCPP, Greece;
 - Commissioning Engineer GT Plant - Coolkeragh 400MW CCPP, UK;
 - Performance Calculation Engineer - CCPP Projects:
 - Performance Test Engineer - Kulim CCPP Proj. (Malaysia) & Csepel CCPP Proj. (Hungary);

Training Objectives

- Help industry assess steam systems and achieve energy and cost savings through
 - Proper operation and controls
 - System maintenance
 - Appropriate process uses of steam
 - Cogeneration and
 - Application of state-of-the-art technologies

- Introduce and demonstrate the functionality of US DOE publicly available steam system optimization assessment software tools

General Summary

- The 2-Day End-User training begins by defining the Systems Approach and how it applies for optimizing an industrial and/or institutional steam system

- The training covers the operation of typical industrial steam systems that include
 - Generation
 - Distribution
 - End-uses / Combined Heat & Power and
 - Condensate recovery

General Summary

- The training identifies *performance improvement opportunities* that lead to the optimization of the overall steam system
- The workshop discusses methods of system efficiency improvements, methodologies for quantifying energy and cost savings from these improvements, aspects of implementation and continuous improvement programs

General Summary

- Demonstration and hands-on functionality and use of the US DOE's Steam Best Practices Program. These include:
 - Steam System Scoping Tool (SSST)
 - Steam System Assessment Tool (SSAT)
 - 3E-Plus insulation appraisal software

- Software tools are free and available for download from the websites

- Field examples and applications of using these software tools in an industrial steam system energy assessment

Training – Outline

Day 1

- Laptop setup for all attendees – software tools and program files
- Introduction on UNIDO's projects in Egypt related to Energy in Industry
- Introduction to “Systems Approach”
- Review of steam system fundamentals – thermodynamics
- Review of the US DOE Steam System Scoping Tool (SSST)
- Student Exercise – Evaluation of an industrial plant steam system using the SSST and identifying energy savings areas
- Coffee / Tea Break

Training – Outline

Day 1

- Review of the US DOE's Steam System Assessment Tool (SSAT)
- Utility Costs
 - Power
 - Fuel
 - Water
- Identification of impact boiler – example from industrial plant
- Steam Cost Indicator
- SSAT Quick Start Section

Training – Outline

Day 1

- Calculation of boiler efficiency using field measurements
- Boiler Losses
 - Shell Loss
 - Blowdown Loss
 - Stack Loss
- SSAT “Site Detail” Section
- Develop a 1-header SSAT steam system Model
- Understanding marginal steam cost
- Lunch Break

Training – Outline

Day 1

- Blowdown & Flash Steam
- Steam Generation Conditions
- Letdowns / PRVs
- Deaerator
- Heat Recovery Components
- Condensate Recovery
- Distribution Losses
- Marginal Steam Cost Discussion / Comparison
- Coffee / Tea Break

Training – Outline

Day 1

- Fundamentals of Turbines
- Backpressure Turbines
- Modeling Backpressure Turbines in SSAT
- Hands-On Student Exercises
- Condensing Turbines
- Adjourn

Training – Outline

Day 2

- Review Day 1 material
- Questions and Answers on material covered on Day 1
- Steam System Optimization – Generation Area
 - Boiler Efficiency Improvement
 - Blowdown Management
 - Blowdown Energy Recovery
 - Feedwater Economizers / Combustion AirPreheaters
 - Excess Air Control
 - Fuel Switching
- Hands-On Student Exercises
- Coffee / Tea Break

Training – Outline

Day 2

- Steam System Optimization – Distribution Area
 - Steam Leaks
 - Heat Transfer Loss Through Insulation
- Student Exercise – Complete examples on steam leaks and insulation heat loss using the SSAT software tool
- 3E Plus Insulation Evaluation Software
- Steam System Optimization – End-Use Area
 - Steam Generation Condition Impacts
 - Steam Demand (End Use)
- SSAT Steam Demand Savings Projects
- Lunch Break

Training – Outline

Day 2

- Steam System Optimization – Condensate Recovery Area
 - Steam Trap Management Program
 - Evaluation of Condensate Recovery Systems
 - Condensate Flash Tanks
 - Condensate Tank Vents
- Student Exercise – Complete examples on condensate recovery and condensate flash steam recovery using the SSAT software tool

Training – Outline

Day 2

- Steam System Optimization – Combined Heat & Power Area
 - BackPressure Turbine – PRV Operations
 - SSAT Turbine Projects Economics
 - Condensing Turbine Impacts
 - SSAT Condensing Turbine Projects
- Coffee / Tea Break
- Conclusions
- Tools & Resources

Personal Goals

- Introduction of attendees
- Any major issues or concerns as regards the course material, timeline, etc.
- Identification of possible areas which need more in-depth coverage based on the interests of the attendees

Overview

Overall Energy Usage

Steam Energy Usage

The Systems Approach

Steam System Optimization (SSO)

Industry accounts over 50% of world energy use

2011 World Energy Use: 435.1 Quads

Source: EIA/International Energy Outlook 2013

1 quad Btu = 1.055 EJ

Egypt

Egypt's Primary Energy Supply 2013

Figure 1. Primary energy consumption in Egypt, by fuel, 2013

Steam Users

➤ Heavy Steam Users

- Petrochemicals
- Petroleum Refining
- Forest Products (Pulp & Paper)
- Food & Beverage
- Plastics
- Rubber
- Textiles
- Pharmaceuticals
- Manufacturing Assembly

Steam Users

➤ Medium Steam Users

- Large commercial heating
- Breweries
- Laundries
- Bakeries
- Cooking
- Metal Fabrication
- Large chiller systems

➤ Small Steam Users

- Electronics
- Paint booths
- Humidification systems

Why Use Steam?

- Extremely efficient as a heating source – constant temperature, highest heat transfer (condensing) coefficients
- Extremely cost effective to distribute to point-of-use
- Can be controlled very accurately
- A very flexible energy transfer medium – can be used for process heating as well as power generation
- Technology and applications are tried and proven at large as well as small-scale
- Significant system benefits!

The Systems Approach

- Key to cost-effective plant utility system operations and maintenance
- Pay attention to the system as a whole, not just to individual pieces of equipment
- Analyze both the supply and demand sides of systems and how they interact
- Most industrial systems will need a Systems Approach for proper analysis
- Will lead to significantly higher energy and cost savings than a “component level analysis”

The Systems Approach

**15 kW motor
efficiency = 91%**

**Combined motor &
pump efficiency = 59%**

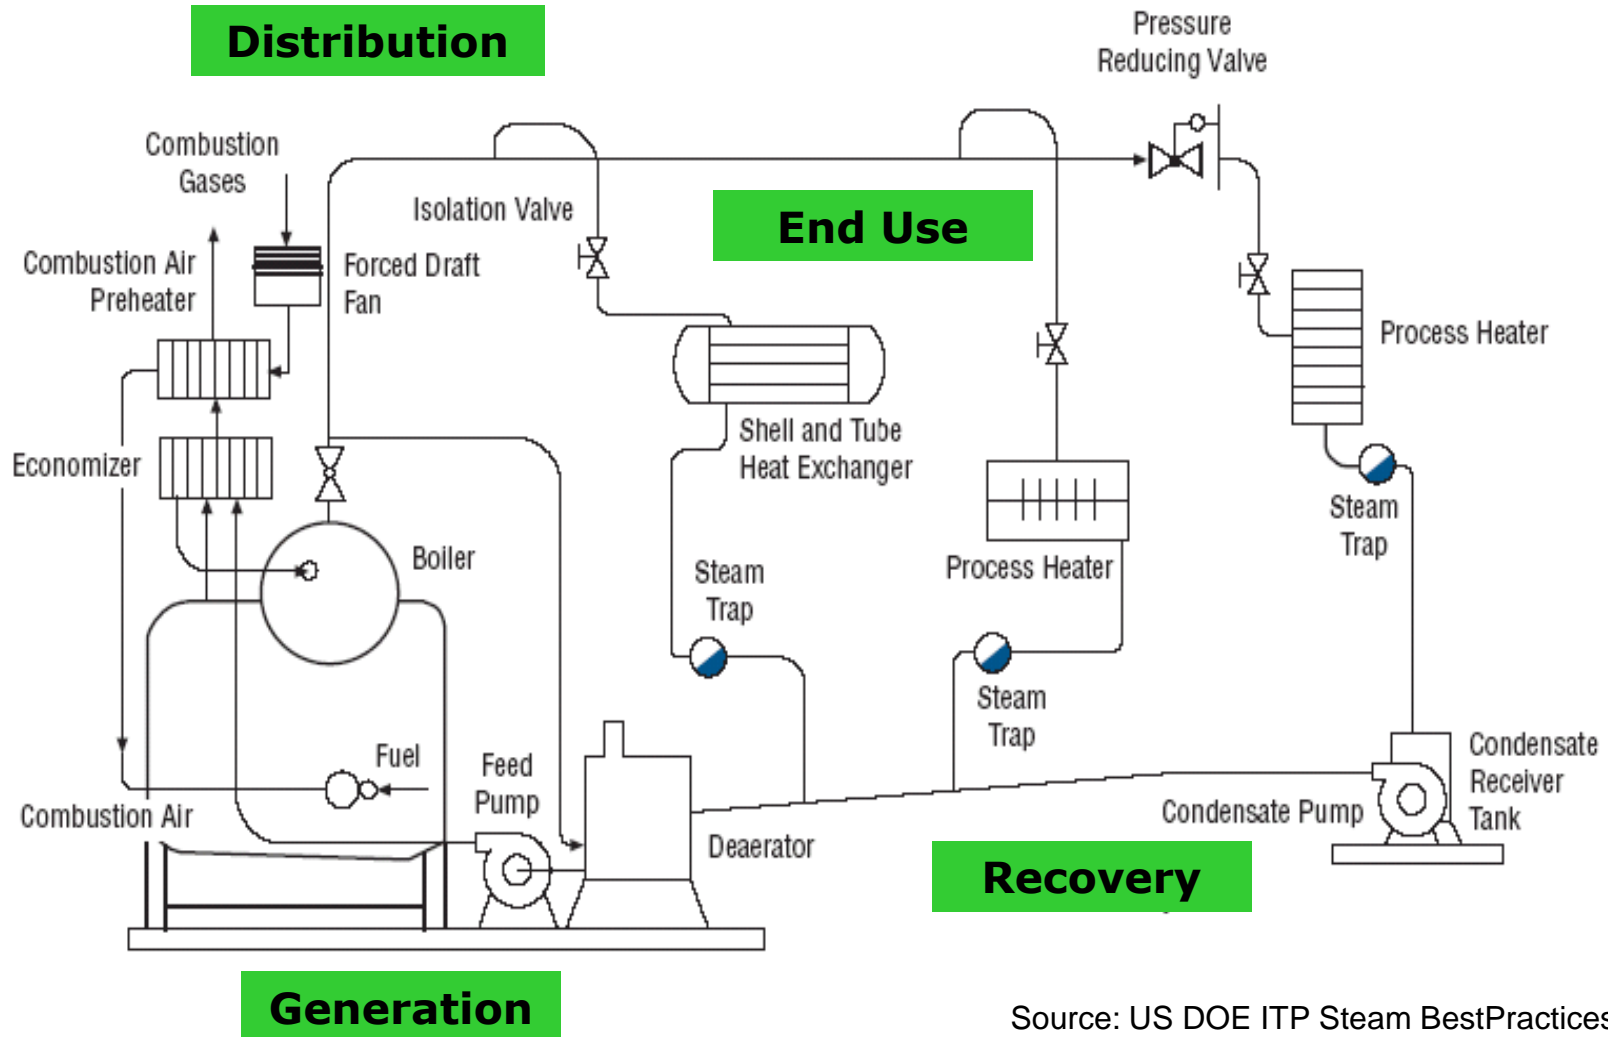

**System
efficiency = 13%**

The Systems Approach

- **Establish** current system conditions, operating parameters, and system energy use
- **Investigate** how the total system presently operates
- **Identify** potential areas where system operation can be improved
- **Analyze** the impacts of potential improvements to the plant system
- **Implement** system improvements that meet plant operational and financial criteria
- Continue to **monitor** overall system performance

Generic Steam System

Source: US DOE ITP Steam BestPractices Program

Industrial Steam System Optimization

- Needs to follow a SYSTEMS Approach
- Focuses on how steam system energy is managed in a plant
- Industrial steam demands change over time and operations of steam system assets should be optimized on a continuous basis
- BestPractices during design, procurement, operations and maintenance must be followed
- Understanding of the fundamentals and tools and resources available is key for a SSO program

Save Energy Now All Plants Assessed (2006-2010)

Total Plants Assessed:	nearly 2,445
Identified Cost Savings:	\$1.4 billion (2,349 reporting)
Identified Energy Savings:	200 Peta Joules (source)
Identified CO₂ Savings:	11.9 million metric tons

- **Implemented approximately 1/3 of cost savings**
- **Another 1/3 is in progress and planned**

<http://www1.eere.energy.gov/industry/saveenergynow/assessments.html>

Identified Savings per Plant Summary (in US)

System Type (No. of SENAs)	Average Recommended Source Energy Savings (GJ/plant per year)	Average Percent Source Energy Savings Recommended (%)	Average Recommended Cost Savings (\$/plant per year)	Average Natural Gas Savings Recommended (GJ/plant per year)	Average CO2 Savings Recommended (Tons/plant per year)
Compressed Air (127)	30,800	2.2	\$177,000	440	1,700
Fans (40)	206,900	3.1	\$1,151,000	38,400	9,000
Process Heating (213)	246,300	11.2	\$1,582,000	187,400	13,300
Pumps (80)	42,400	1.2	\$219,000	1,250	2,400
Steam (313)	270,100	7.0	\$2,075,000	220,000	18,000
Multi-System- Paper (20)	420,200	4.7	\$2,782,000	217,900	21,000

Steam System Fundamentals

Steam System Components

Thermodynamics – Steam Properties

Conservation of Mass

Conservation of Energy

Fuels

Steam System Optimization Opportunities

Steam System Components

➤ Generation

- Boiler
- Boiler auxiliaries
- Water treatment equipment
- Deaerator
- Feedwater Pumps
- Fuel storage and handling equipment

➤ Distribution

- Steam piping
- Pressure reducing stations

➤ End-use

- Steam turbines
- Heat exchangers
- Live steam injection
- Stripping columns
- Evaporators, etc.

➤ Recovery

- Steam traps
- Condensate recovery and return system
- Condensate pumps

Fire-Tube Boiler

- Steam pressure limited
 - Typical 20 bars maximum
- Steam flow rate limited
 - Typical 1,200 BHp maximum
 - 20 tons/hr
- Saturated steam output
- One inherent efficiency advantage over water tube type – shell loss is minimal
- Generally manufactured offsite
- Many different styles

Fire Tube Boilers

Water-Tube Boiler

- Operating pressures range from atmospheric to in excess of 250 bars
- Steam production ranges from 2 Tph to 5,000 Tph
- Saturated or superheated steam output
- Constructed onsite or offsite
- Many different styles
- Compact units now on the market!

Source: US DOE ITP Steam BestPractices Program

Water Tube Boilers

Boilers & Boiler Auxiliaries

- Two main boiler types
 - Fire-tube
 - Water-tube
- Fans - Air flow configuration
 - Forced draft
 - Induced draft
 - Balanced draft
- Combustion air pre-heaters
- Feedwater economizers / condensing economizers
- Fuel flow valves and combustion controls
- Excess air controls
- Sensors
- Soot blowers – steam or compressed air
- Pollution control equipment

Fuel Storage & Handling Equipment

- Mainly for solid and liquid fuels
 - Primary
 - Back-up / Standby

Deaerator

- Removes dissolved oxygen from make-up water and condensate
- Boiler integrity
- Several different styles
 - Spray type
 - Tray type
- Maybe combined with feedwater heater and storage
- Will always have a steam vent!

Pumps

- Boiler Feedwater (BFW)
- Condensate
- Make-up water
- Other auxiliary services

Water Treatment Equipment

- Extremely important boiler water chemistry
- Integrity of boiler
- Depends on boiler pressure and water quality
- Several options
 - Softening
 - Dealkalization
 - Demineralization
 - Reverse osmosis
 - Condensate polishing
 - Chemical treatment

Steam Piping

- Transports steam to end use
- Pipe racks
- Pressure headers
- Isolation valves
- Relief valves
- Drain points, etc

Pressure Reducing Stations

- Also known as Letdown valves
- Provide steam flow control
- Provide pressure header balancing
- Operates on a feedback loop
- Always need a bypass for emergency and repair conditions

Steam Turbines

- Devices which convert thermal energy into shaft power
- Can generate electrical power through a generator
- Can drive a mechanical equipment – fan, pump, compressor, chiller, etc.
- Different types
 - Backpressure
 - Extraction
 - Condensing
 - Combination of the above

Heat Exchangers

- Different types
 - Shell & Tube
 - Plate / Frame
 - Tube in tube
 - Spiral, etc.
- Based on applications
- Steam transfers thermal energy to process fluid and forms condensate
- Industry standards for designs and applications

Other End Use Equipment

Other End Use Equipment

Evaporators

- Distillation tower
 - Stripping column
- Reformers
- Separators

Reboilers

- Steam ejectors
- Steam injectors
- Thermocompressors

Steam Traps

- Prevent steam from escaping without transfer of heat
- Several different types of traps
 - Thermostatic
 - Mechanical
 - Thermodynamic
 - Orifice
- Application – very important
- Steam Trap Management

Flash Tanks

- Recover flash steam from condensate
- Eliminate potential condensate return problems
 - Water hammer
 - Back-pressure
 - 2-phase flow
- Blowdown flash tanks reduce temperature of water before discharging to sewer

Condensate Recovery System

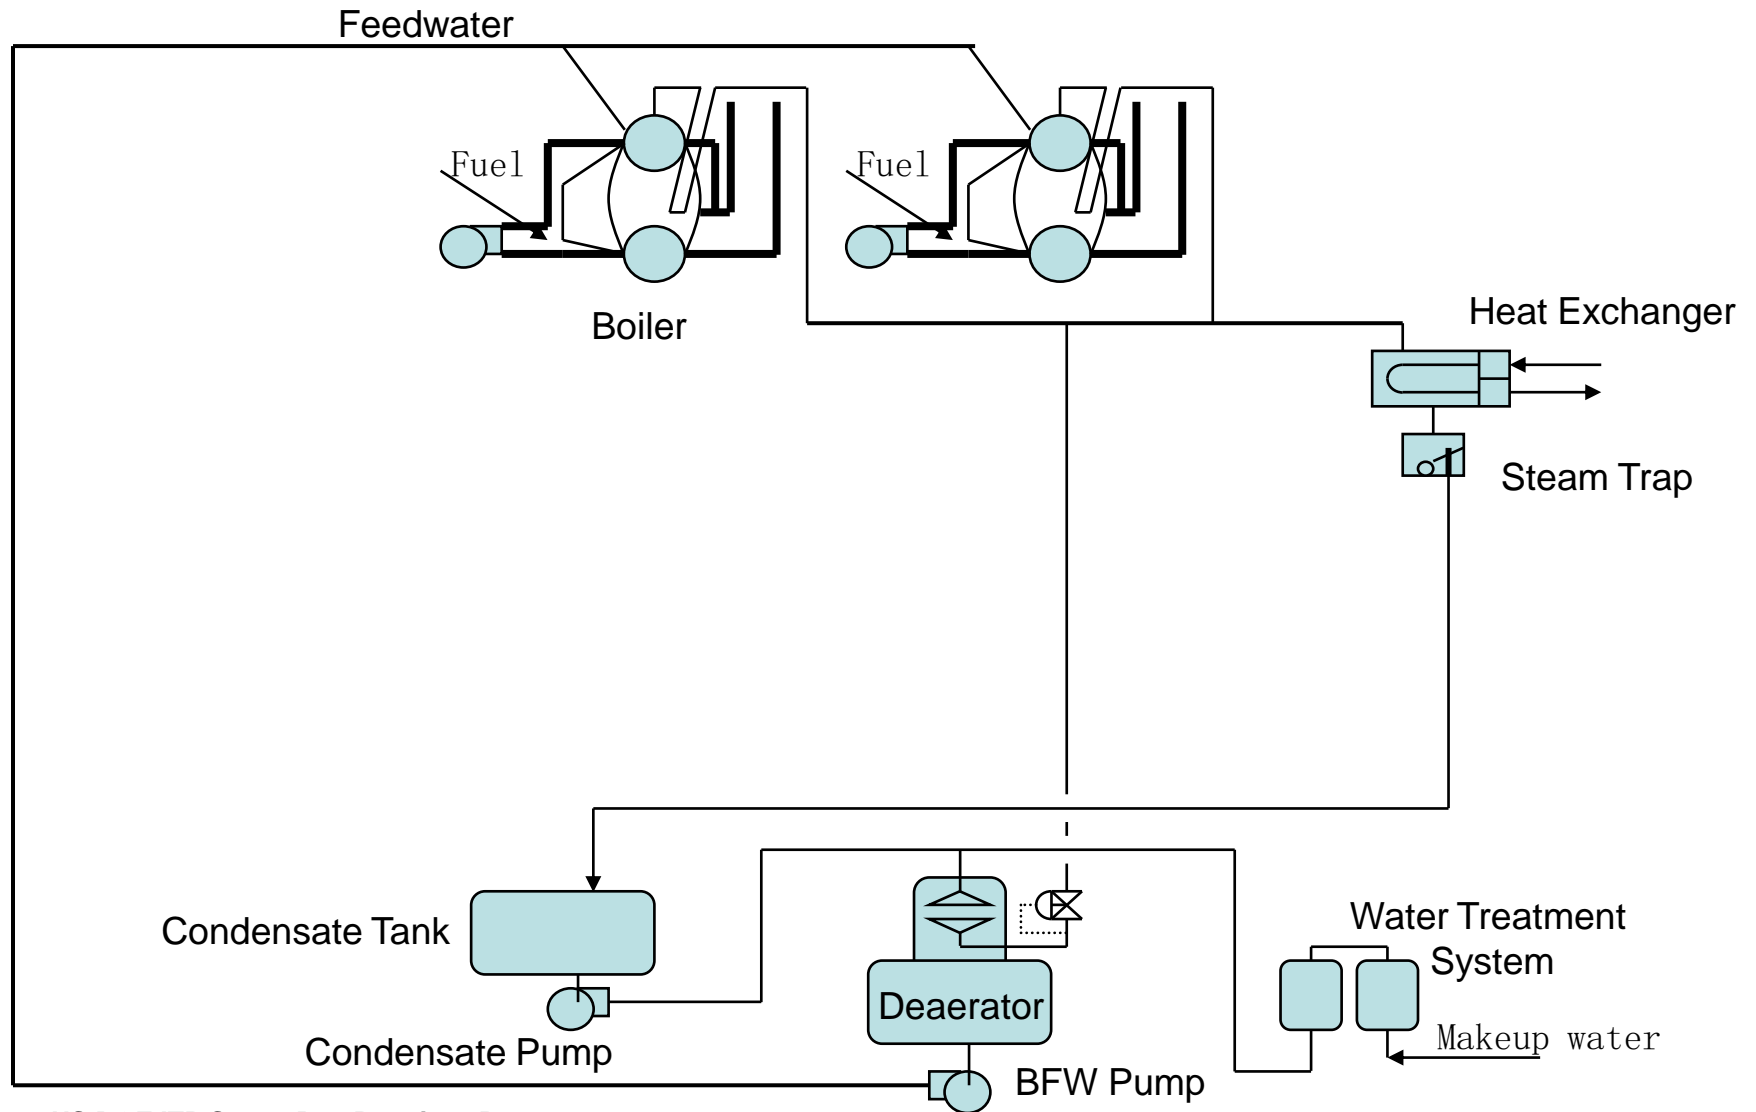

- Primary / Secondary
- Pumped / Pressure-driven
- Pumped – Electric-driven or Steam-driven
- Returns condensate back with the highest thermal energy to the boiler house

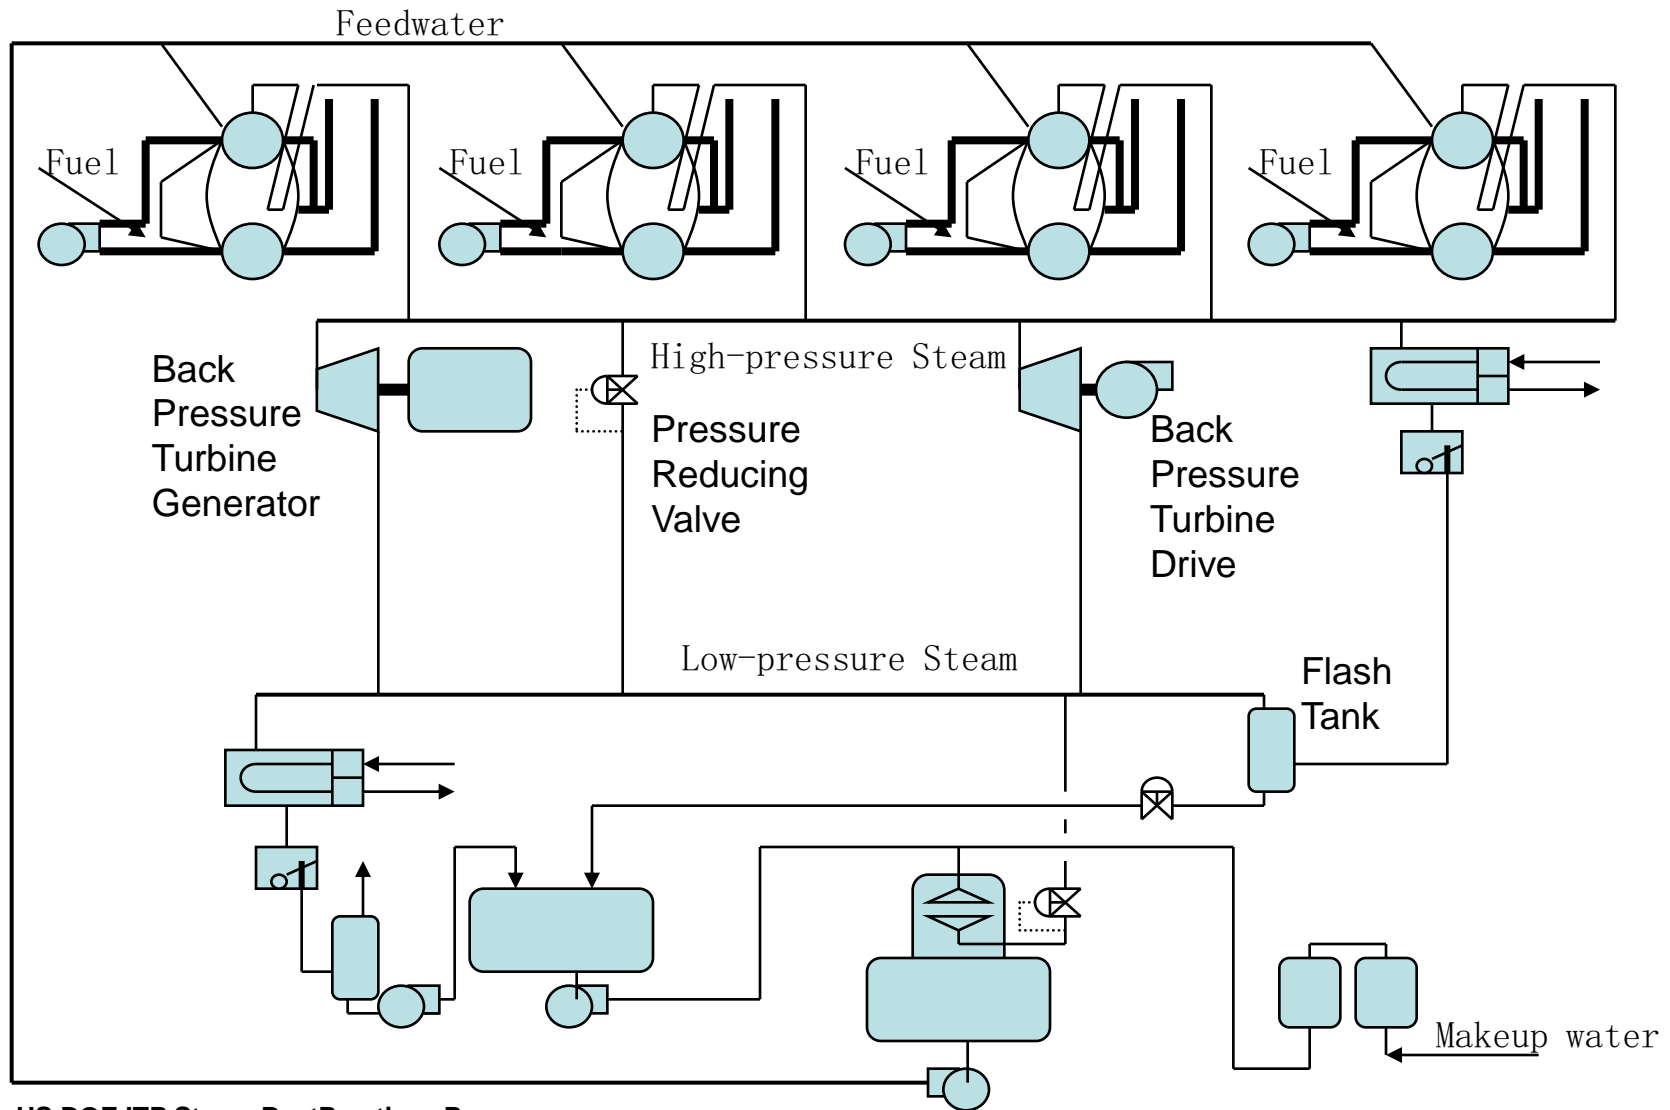

Condensate Tank

- Provides for a common receiver
- Typically, located above grade to provide for pump suction requirements
- May be combined with deaerator and feedwater heater and storage

Steam

- What is STEAM?
 - Saturated or Superheated Water Vapor
- When water is heated to or above its boiling point, it changes into STEAM

Liquid Water
↓
Gaseous Steam

Steam

What is STEAM?

When water is heated to or above it's boiling point, it changes into STEAM

Steam Thermodynamics

➤ Thermodynamic States of a Pure Substance

- Subcooled
 - Liquid (Water)
 - Temperature and Pressure are independent
 - Energy content \propto Temperature
- Saturated
 - Liquid / 2-Phase / Vapor
 - Temperature and Pressure are **dependent**
 - $0 \leq \text{Quality} \leq 1$
- Superheated
 - Vapor (Steam)
 - Temperature and Pressure are independent
 - Energy content \propto Temperature & Pressure

Steam Thermodynamics

- Thermodynamic Properties of Steam
 - P - Pressure (bars, atmospheres, kPa, MPa)
 - T - Temperature (°C)
 - Absolute Temperature (K)
 - X - Quality
 - ρ - Density (kg/m^3)
 - V - Volume (m^3/kg)
 - H - Enthalpy (kJ, kcal)
 - h - Specific Enthalpy (kJ/kg, kcal/kg)
 - S - Entropy (kJ/K, kcal/K)
 - s - Specific Entropy (kJ/kg-K, kcal/kg-K)

Steam Thermodynamics

➤ Thermophysical Properties of Steam

- C_p - Specific Heat at constant pressure (kJ/kg-K, kcal/kg-K)
- C_v – Specific Heat at constant volume (kJ/kg-K, kcal/kg-K)
- V_s - Velocity of sound (m/s)
- μ - Viscosity (Pa.s)
- K – Thermal Conductivity (W/m-K)

Steam Thermodynamics

➤ Pressure – Temperature Relationship

- As Pressure \uparrow - Temperature \uparrow

Steam Thermodynamics

➤ H-S diagram (Mollier Diagram)

Steam Thermodynamics

➤ Steam Tables

p steam (bars)	t steam (C)	Pf (kg/m3)	Vf (m3/kg)	Hf (kJ/kg)	Hfg (kJ/kg)	Hg (kJ/kg)	Sg (kJ/kgK)	Sfg (kJ/kgK)	Sg (kJ/kgK)
0.5	81.31	971	3.244	340.4	2,305	2,676	1.091	6.502	7.593

90.0	303.4	705.4	0.02048	1,363	1,379	2,742	3.285	2.392	5.677
100.0	311	688.6	0.01802	1,407	1,317	2,724	3.359	2.255	5.614

Steam Thermodynamics

- Steam Properties
 - Steam Tables
 - Mollier Diagrams
 - ASHRAE Fundamentals Handbook
 - Tabulated Data
 - P-h diagram
 - Software Programs
 - Equation of State for different refrigerants
 - Engineering Equation Solver (EES)
 - REFPROP - National Institute of Standards & Testing (NIST)
- Reference Point
 - Maybe different for different sources!!

Steam System Analysis

- Steady State Steady Flow (SSSF) analysis
 - Neglect the time dependent terms
 - Dynamic responses are not considered
 - Start-up, Shut-down and upset (or trip) conditions are neglected
- Average operating conditions are used
- Seasonality, Production rates can be dealt with “bin analysis” methodology
- IMPACT level-analysis is conducted on systems

Steam System Analysis

- In order to properly evaluate steam systems the physics of each process must be understood
 - Thermodynamics
 - Heat transfer
 - Fluid flow
- Process measurements
 - Temperatures, Pressures, Flows, etc.
- U.S.DOE Tools Suite
 - Steam System Scoping Tool (SSST)
 - Steam System Assessment Tool (SSAT)
 - Insulation evaluation software – 3E-Plus
- Commercially available software
 - Aspen Tech
 - ProSteam (KBC Linhoff March)
 - Visual MESA, etc.

Conservation of Mass

- Law: Mass is neither created nor destroyed in the control volume
- Mathematically,
 - Mass flow in = Mass flow out
- Equation format
 - $\Sigma M_{in} = \Sigma M_{out}$
- State of substance & volume flow can change

Steady State Steady Flow

Example: F1

- A shell and tube heat exchanger is used to heat water using steam
- Water flow rate measured as 600 litres/min
- Steam flow rate is not known

Example: F1

- Apply Steady State Steady Flow – **Conservation of Mass**
- Water side: Water flow in = Water flow out
- Steam side: Steam flow in = Condensate flow out

Example: F1

- Apply Steady State Steady Flow – **Conservation of Mass**
- Water side:

Water flow in	= 600 litres/min
	= 600 kg/min
Water flow out	= 600 litres/min
	= 600 kg/min
- Steam side:

Steam flow in	= Condensate flow out
---------------	-----------------------

Conservation of Energy

- Law: Energy can neither be created nor destroyed in the control volume. It can only be changed from one form to another.
- Mathematically,
 - Energy flow in + Heat = Energy flow out + Work
- Equation format
 - $\Sigma M_{in} * h_{in} + Q = \Sigma M_{out} * h_{out} + W$

Steady State Steady Flow

Example: F1

- Water inlet temperature = 25°C
- Water outlet temperature = 75°C
- Specific heat of water = 4.183 kJ/kg-K
- Heat transferred to water = $M_{\text{water}} * C_p * (T_{\text{out}} - T_{\text{in}})$

$$Q = \frac{600}{60} \times 4.183 \times (75 - 25) \text{ kW}$$

$$Q = 2,091 \text{ kW}$$

Example: F1

- Steam inlet conditions: Saturated steam at atmospheric pressure (1.0 bar)
- Condensate outlet conditions: Saturated at $T = 100^{\circ}\text{C}$
- Heat transferred by steam =
$$M_{\text{steam}} * h_{\text{steam}} - M_{\text{condensate}} * h_{\text{condensate}}$$
- No shaft work is done in the control volume: $W = 0$
- Heat transferred **to** water = Heat transferred **by** steam
- Conservation of Mass: $M_{\text{steam}} = M_{\text{condensate}}$

Example: F1

- $Q = M_{\text{steam}} * (h_{\text{steam}} - h_{\text{condensate}})$
- Steam Property tables provide information on steam and condensate enthalpies
- h_{steam} - Saturated steam at 1.0 bar = 2,676 kJ/kg
- $h_{\text{condensate}}$ - Sat. Condensate at 100°C = 419 kJ/kg

$$Q = M_{\text{steam}} \times (2,676 - 419)$$

$$2,091 = M_{\text{steam}} \times (2,257)$$

$$M_{\text{steam}} = 0.927 \frac{\text{kg}}{\text{s}} = 3,336 \frac{\text{kg}}{\text{h}} = 3.34 \text{ Tph}$$

Example: F1

Pressure (bars)	t sat (C)	Quality	Enthalpy (kJ/kg)
0.5	81.3	0	340.4
0.5	81.3	1	2,645
1.013	100.0	0	419
1.013	100.0	1	2,676
1.5	111.4	0	467.1
1.5	111.4	1	2,693
2	120.2	0	504.7

Saturated Liquid

Saturated Vapor
(Dry Steam)

Example: F1

Example: F2

- Steam is directly injected in a vessel to heat water
- Water flow rate required (& measured) by process is 600 litres/min
- Steam flow rate is unknown

Example: F2

- Apply Steady State Steady Flow – **Conservation of Mass**
- Water flow in + Steam flow in = Water flow out

Example: F2

➤ Apply Steady State Steady Flow – Conservation of **Mass**

➤ Water flow in $= M_{\text{waterin}}$ = unknown

Steam flow in $= M_{\text{steam}}$ = unknown

➤ Water flow out $= M_{\text{waterout}}$
 $= 600 \text{ litres/min}$
 $\sim 600 \text{ kg/min}$

➤ $M_{\text{waterin}} + M_{\text{steam}} = M_{\text{waterout}}$ Eqn 1

Example: F2

- Water inlet temperature = 25°C
 - Water outlet temperature = 75°C
 - Steam inlet conditions: Saturated steam at atmospheric pressure (1.0 bar)
 - No shaft work is done in the control volume: $W = 0$
 - Apply Steady State Steady Flow - Conservation of **Energy**
- $$M_{\text{waterin}} * h_{\text{waterin}} + M_{\text{steam}} * h_{\text{steam}} = M_{\text{waterout}} * h_{\text{waterout}} \quad \text{..Eqn 2}$$

Example: F2

- Steam Property tables provide information on steam and sub-cooled water enthalpies
- h_{waterin} - Subcooled water (1.0 bar, 25°C) = 104.8 kJ/kg
- h_{steam} - Saturated steam at 1.0 bar = 2,676 kJ/kg
- h_{waterout} – Subcooled water (1.0 bar, 75°C) = 314 kJ/kg

Pressure i (bars)	Temp i (C)	Quality i	Enthalpy i (kJ/kg)	Density i (kg/m3)
1.013	25.0	-100	104.8	997.1
1.013	75.0	-100	314	974.9
1.013	100.0	1	2,676	0.597

Example: F2

➤ Equation 1 is now written as

$$\begin{aligned}
 M_{waterin} + M_{steam} &= M_{waterout} \\
 M_{waterin} + M_{steam} &= \frac{600}{60} \times \frac{974.9}{1,000} \\
 M_{waterin} + M_{steam} &= 9.75 \\
 M_{waterout} &= 9.75 \frac{kg}{s}
 \end{aligned}$$

$$M_{waterin} + M_{steam} = 9.75 \quad \dots \text{Eqn 1}$$

Example: F2

- Equation 2 can now be written as

$$M_{waterin} \times (104.8) + M_{steam} \times (2,676) = M_{waterout} \times (314)$$

$$M_{waterin} \times (104.8) + M_{steam} \times (2,676) = 9.75 \times (314)$$

$$M_{waterin} \times (104.8) + M_{steam} \times (2,676) = 3,061.5 \quad \dots \text{Eqn 2}$$

- Solving equations 1 and 2 simultaneously provides

$$M_{waterin} = 8.96 \frac{kg}{s} = \frac{8.96}{997.1} \times 1,000 \times 60 \frac{l}{min} = 539 \frac{\text{litres}}{min}$$

$$M_{steam} = 0.793 \frac{kg}{s} = 2,855 \frac{kg}{h} = 2.85 Tph$$

Example: F2

Key Points / Action Items

1. *Use a Systems Approach to optimize steam systems*
2. *There are four major areas of a steam system – Generation, Distribution, End-Use & Recovery*
3. *An understanding of the laws of thermodynamics, heat transfer, fluid flow and steam properties is required for a steam system analysis*
4. *Steam is used all across the industry to do various tasks and is the most effective medium to transport energy and produce shaft work (or power)*
